Melt spun thermoplastic polyurethane polymers

useful as textile fibers and having good tenacity and recovery

and substantially no gelation are disclosed. The polymers are

preparation of "hard" segment oligomer, preparation of "soft"

segment oligomer and final reaction of "hard" segment with

"soft" segment in a twin-screw reaction extruder to obtain a

between the "hard" segments. The "soft" segment oligomer

comprises blocks of polymeric glycol (poly) urethanes end

final polyurethane product having relatively uniform distances

capped with isocyanate groups. The "hard" segment oligomer

comprises blocks of low molecular weight C2-C6 glycol (poly)

prepared by a three-step polymerization process including:
